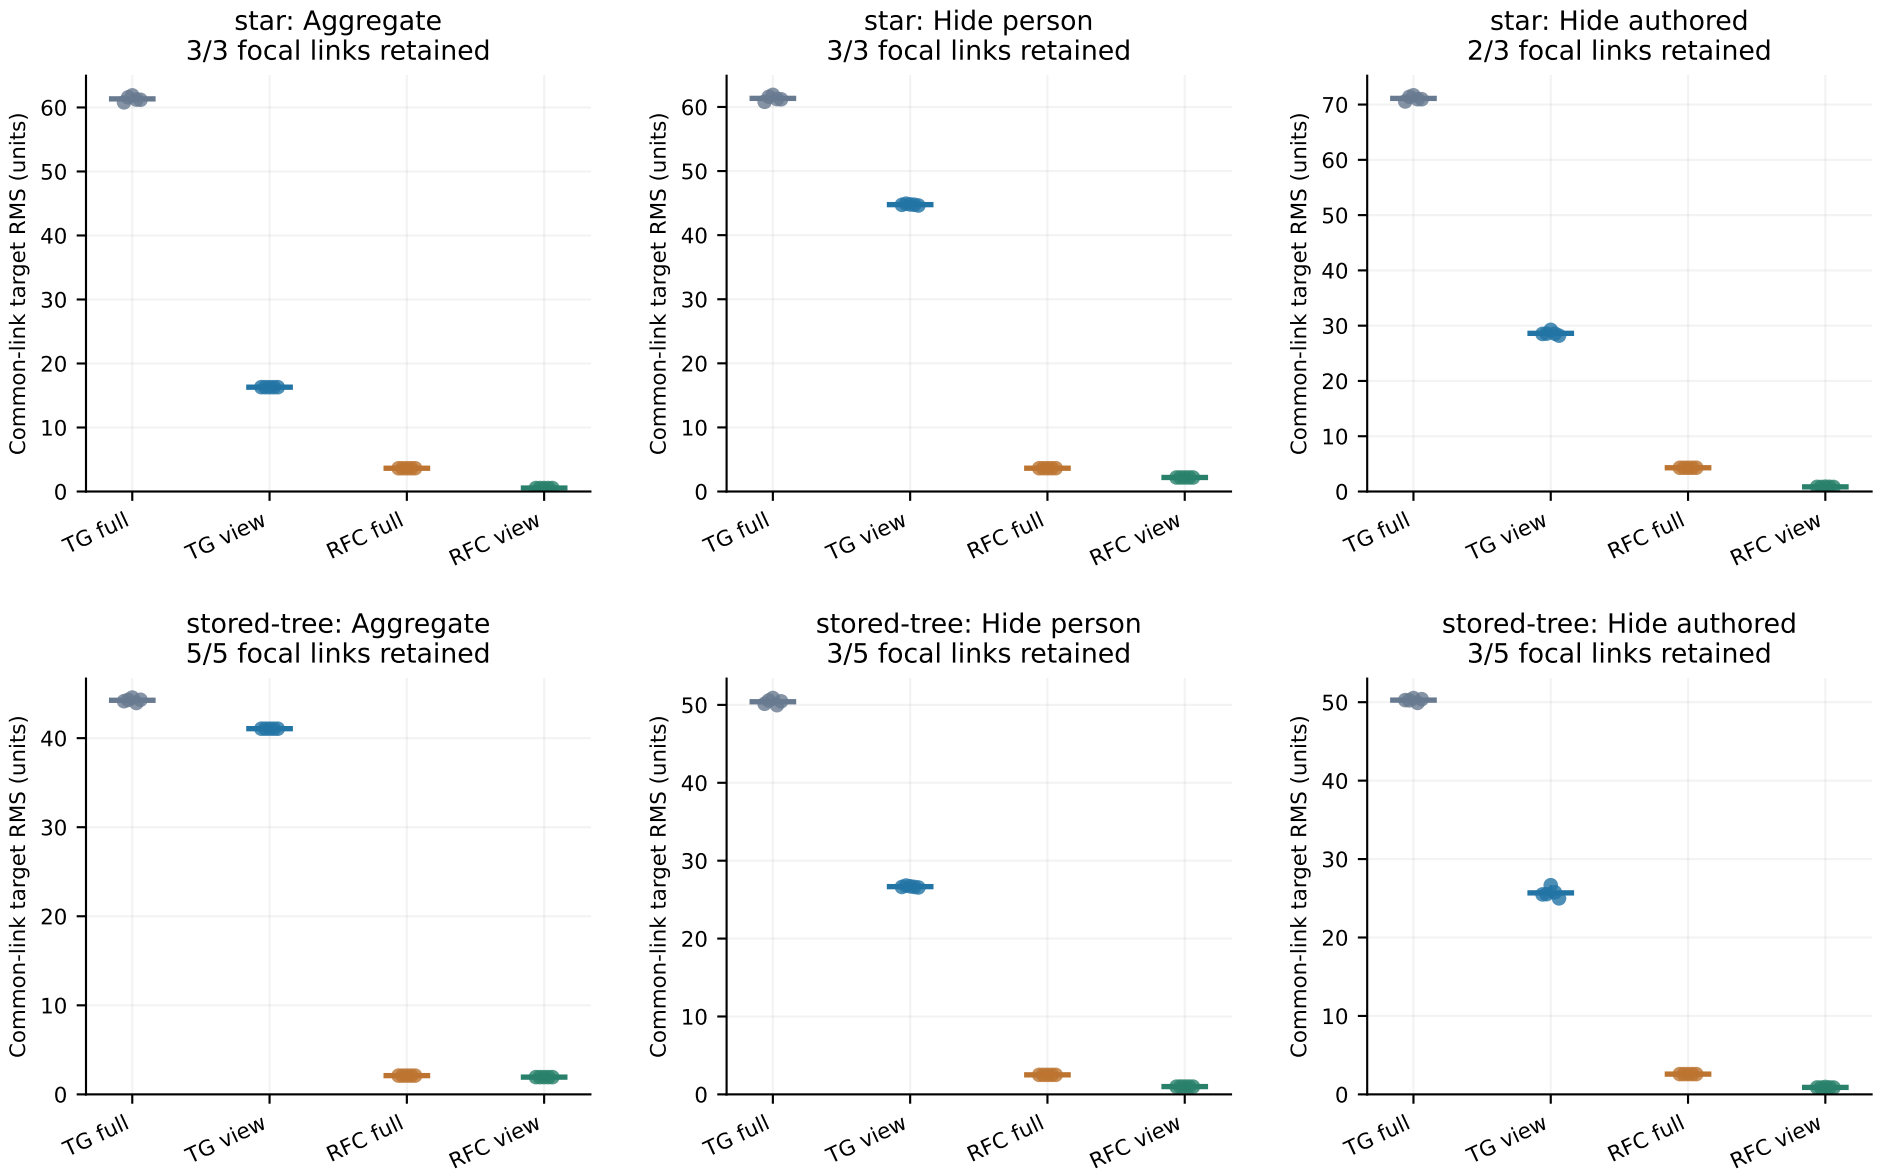
J1. Full and reduced layouts scored on identical retained focal links



J1. Five starts, 4000 integrations each, rigidity 0.1, local damping and exclusion off. Within each panel, the full layout and reduced view are measured on the same retained radial IDs and target 120. Points show every start, bars means and verticals min–max, not confidence intervals. Target subsets differ across panels; no all-graph quality ranking follows from their errors. Angular branch sets and changed degrees are recorded separately. Lens off/on gives exactly identical physical results.
