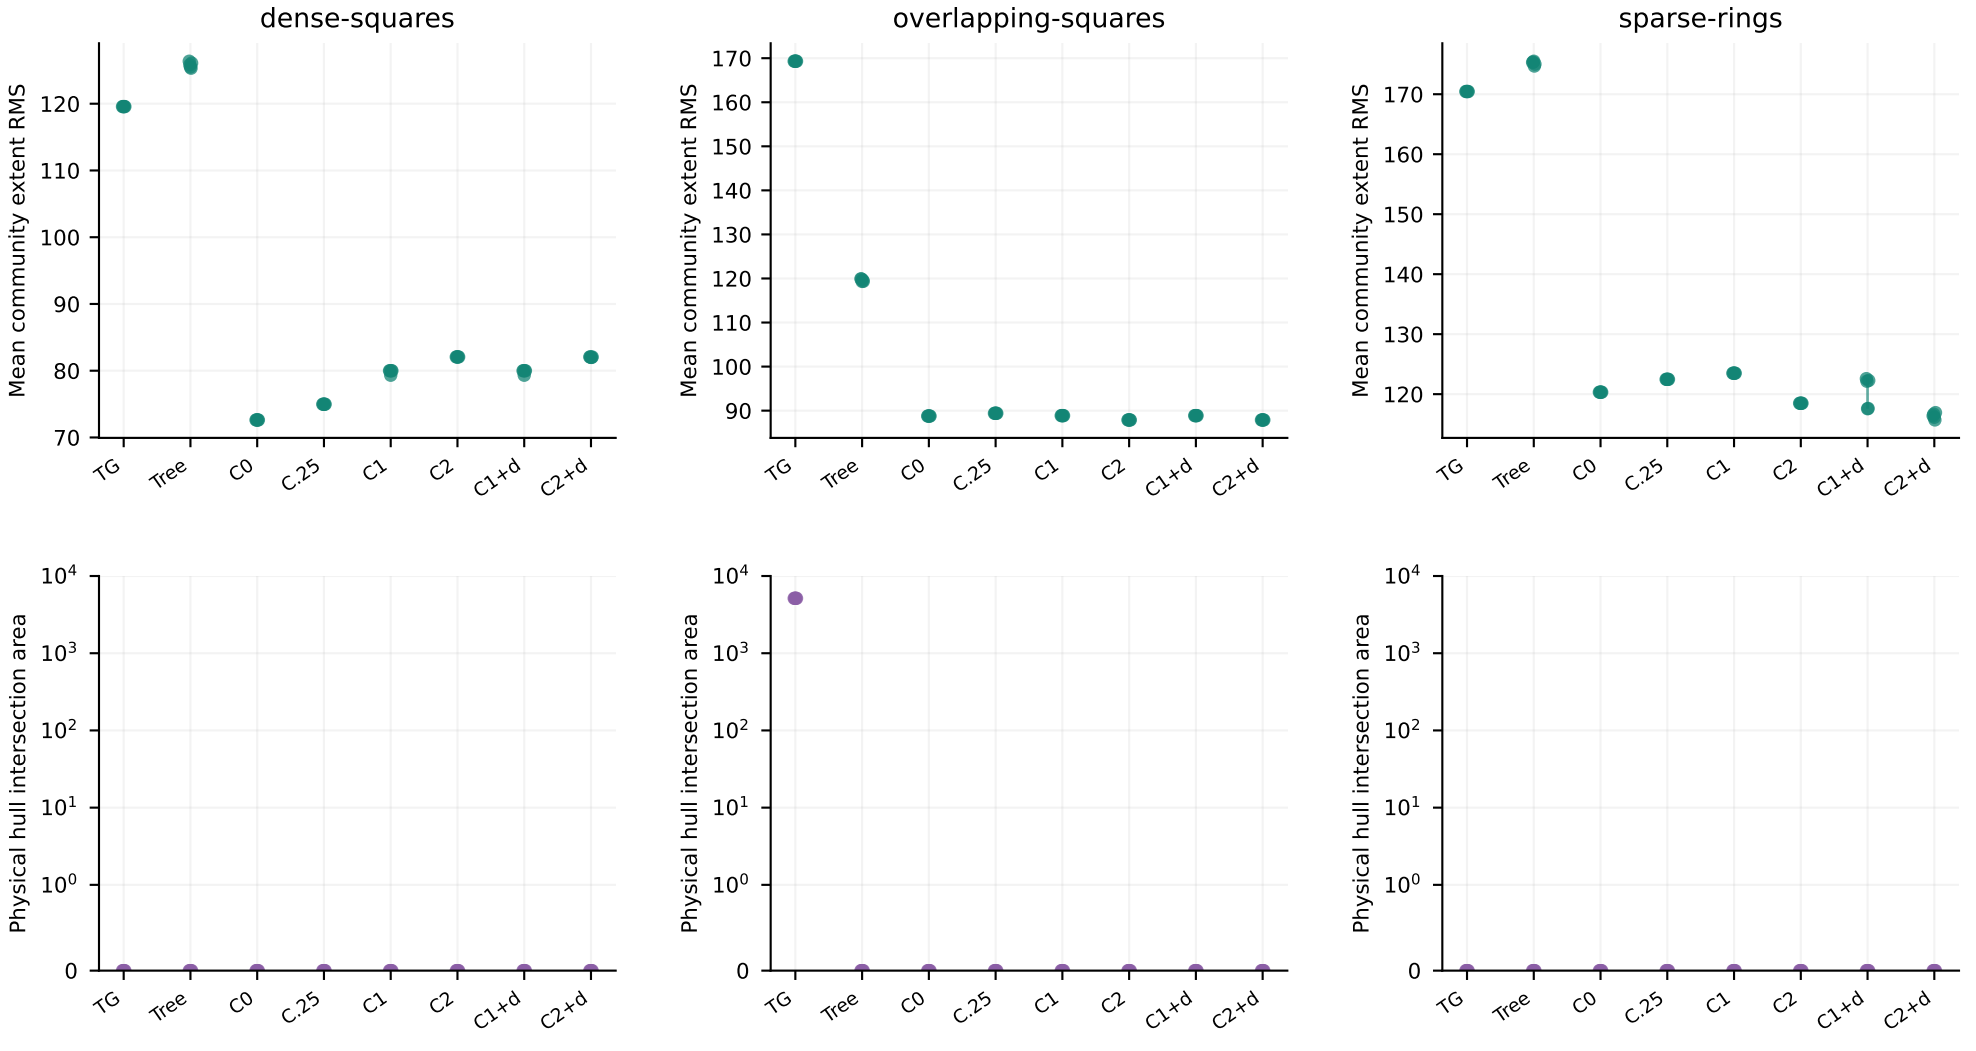
F8. Extent and overlap do not establish readability



F8. Strong load, all five starts. Extent is the RMS member radius about each unweighted physical centroid, then averaged across communities. Overlap is convex member-center intersection area; shared nodes/edges may have zero intersection area. These are geometric observations, not the displayed rounded enclosure or an implemented exclusion force. Crossings and near-node counts are retained separately; no label-collision or human-readability claim.
