
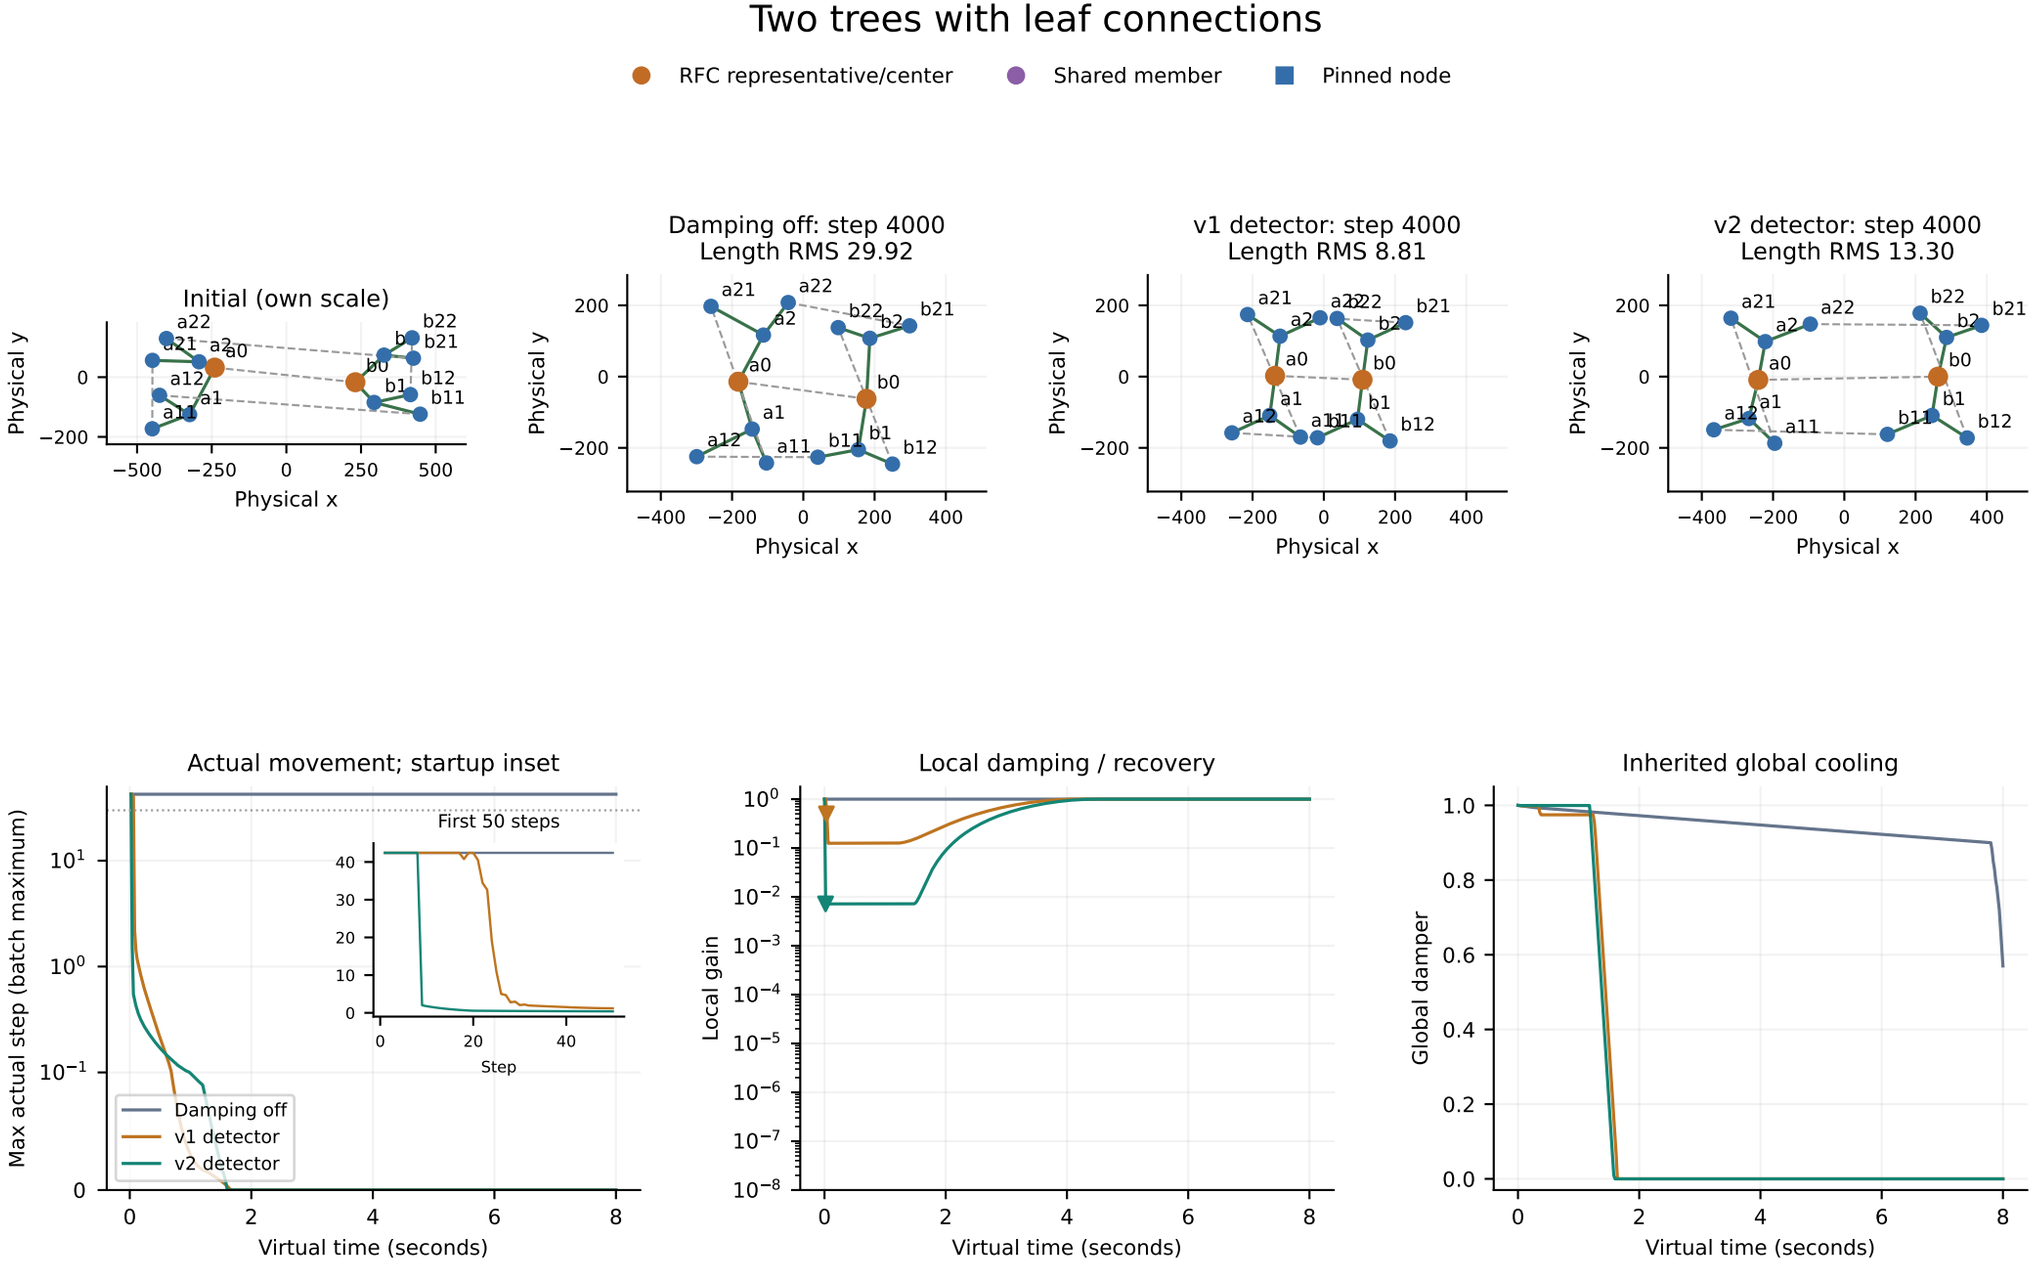

Figure 5. Large-step counts off/v1/v2: 4000 / 23 / 8. Final panels share physical axes; initial uses its labelled own scale. Motion shows the maximum over each batch's ten actual integrations, not net batch displacement; inset shows individual steps. Triangles mark first detection. Straight edges and approximate cluster shading depict headless membership, not browser routing or exclusion. Final snapshots and low motion alone do not establish equilibrium or readability.
