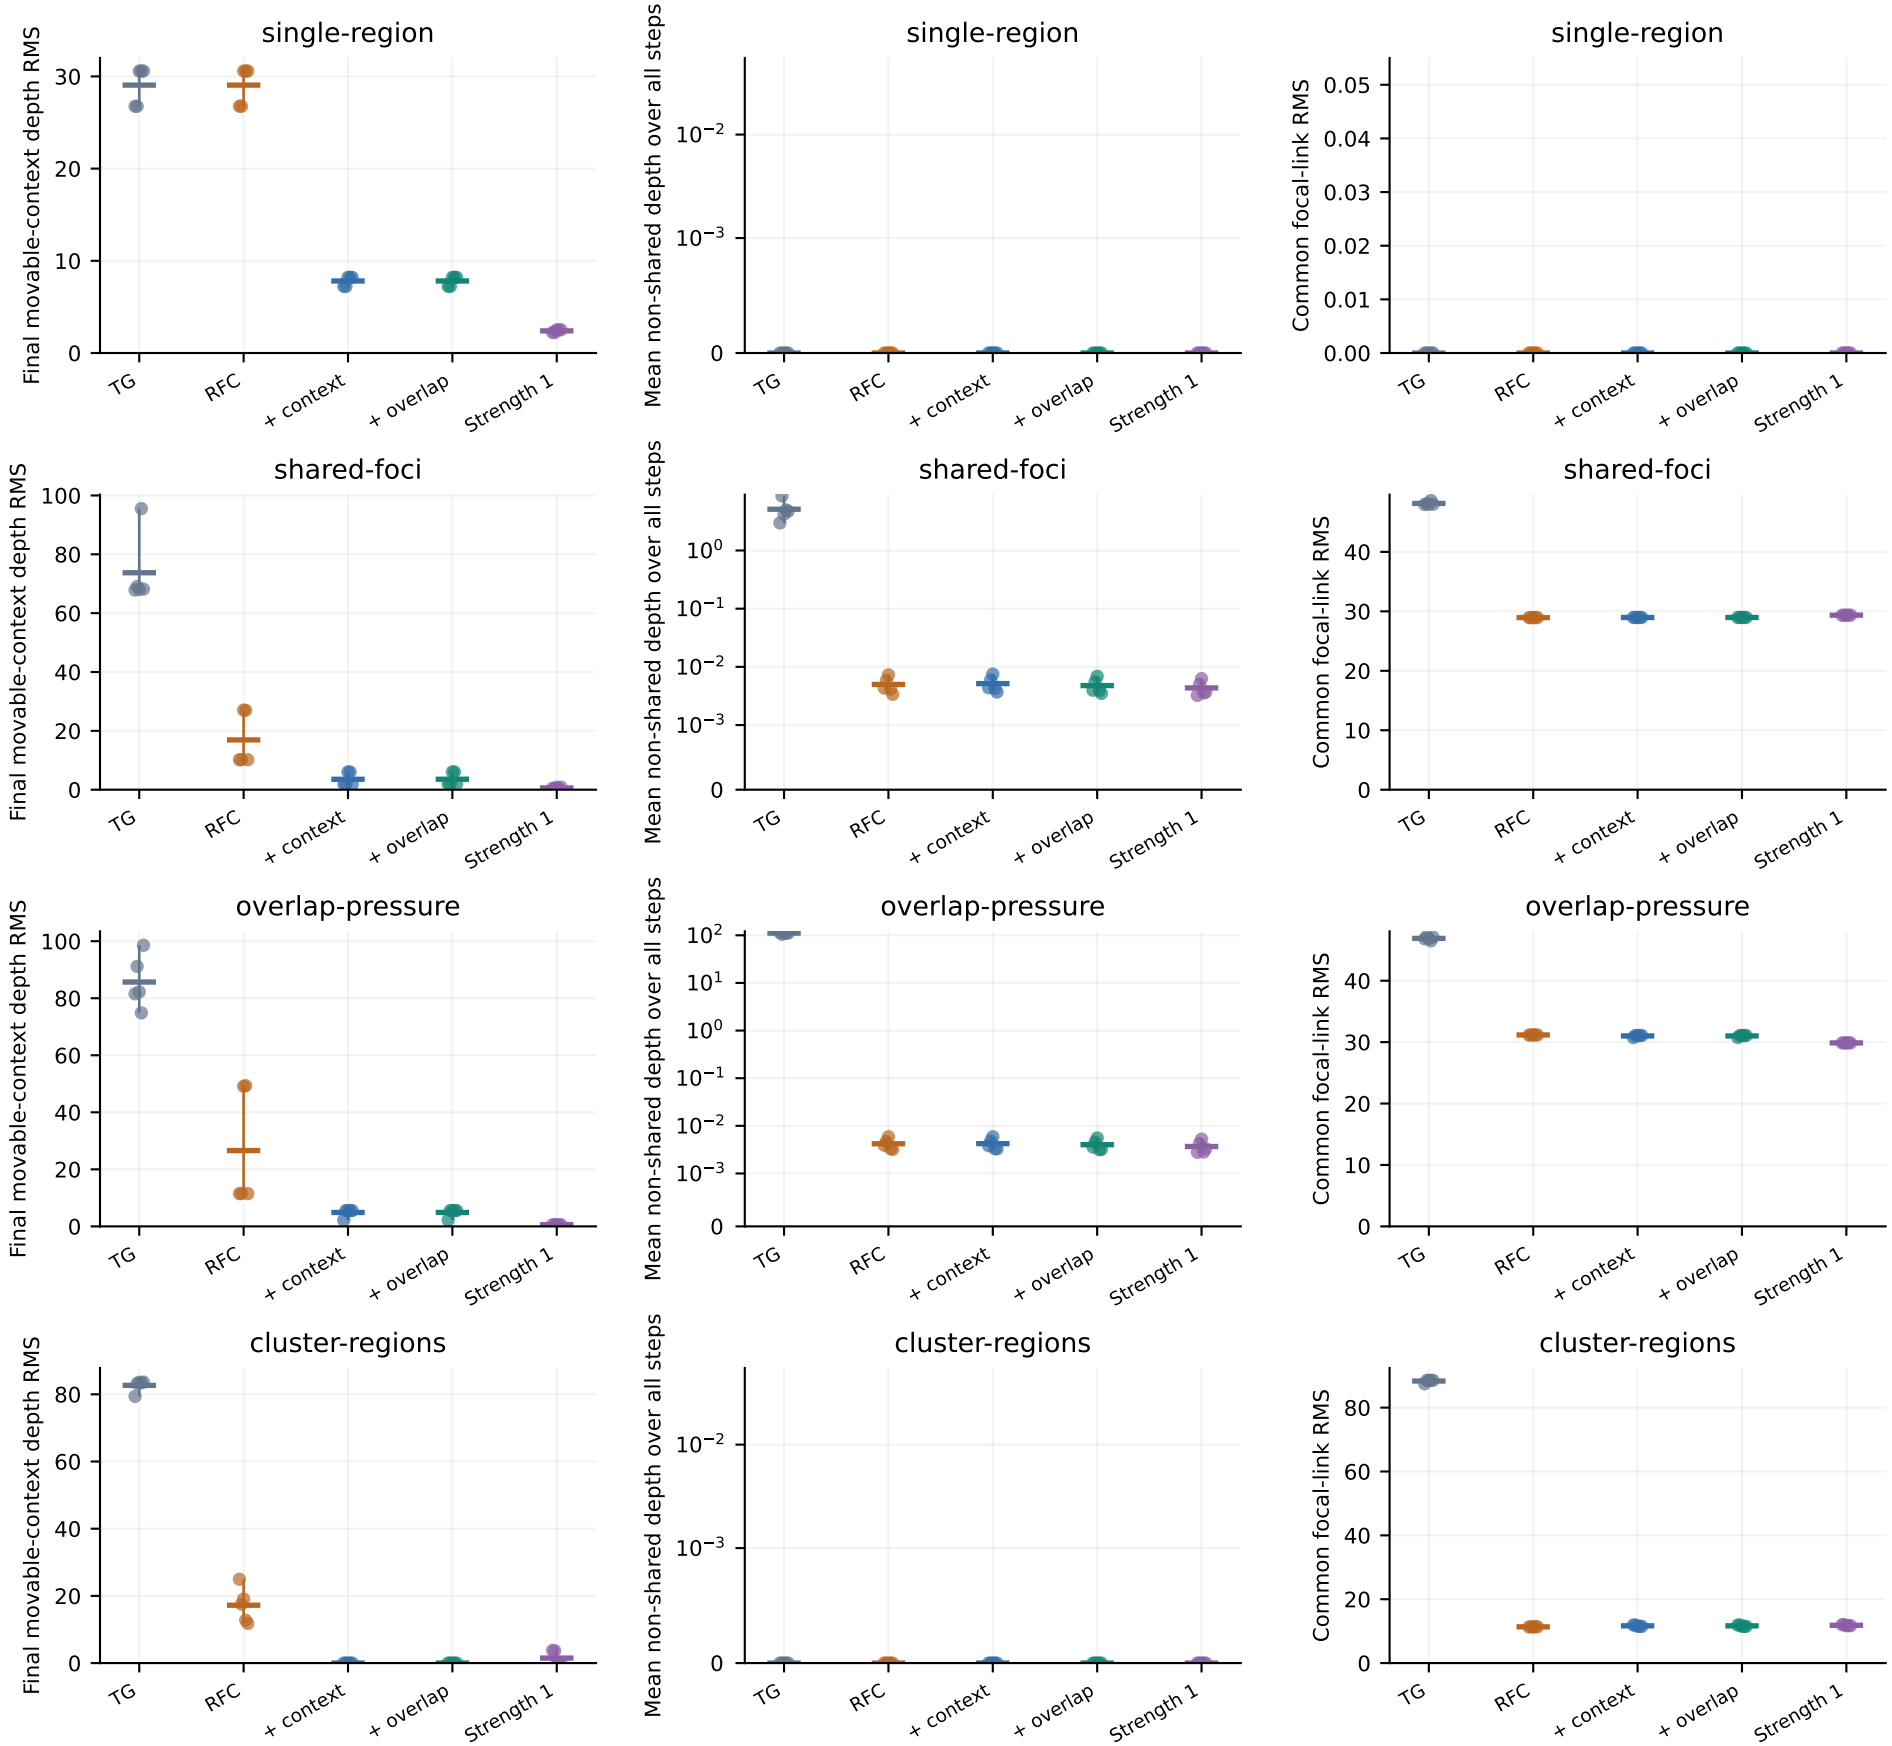
I1. Focal-region exclusion: common measures across every condition



I1. Five matched starts per case/mode, 4000 integrations, global rigidity 0.1 and local damping off. Points show all starts, verticals min–max and bars means, not confidence intervals. Context/focal errors use the same hypothetical region-fitting policy even for TG/RFC controls. Non-shared exposure includes every integration; final non-shared intrusion is zero in the RFC conditions here. Link objectives and region sizes remain in the records. Pinned intruders are reported separately.
