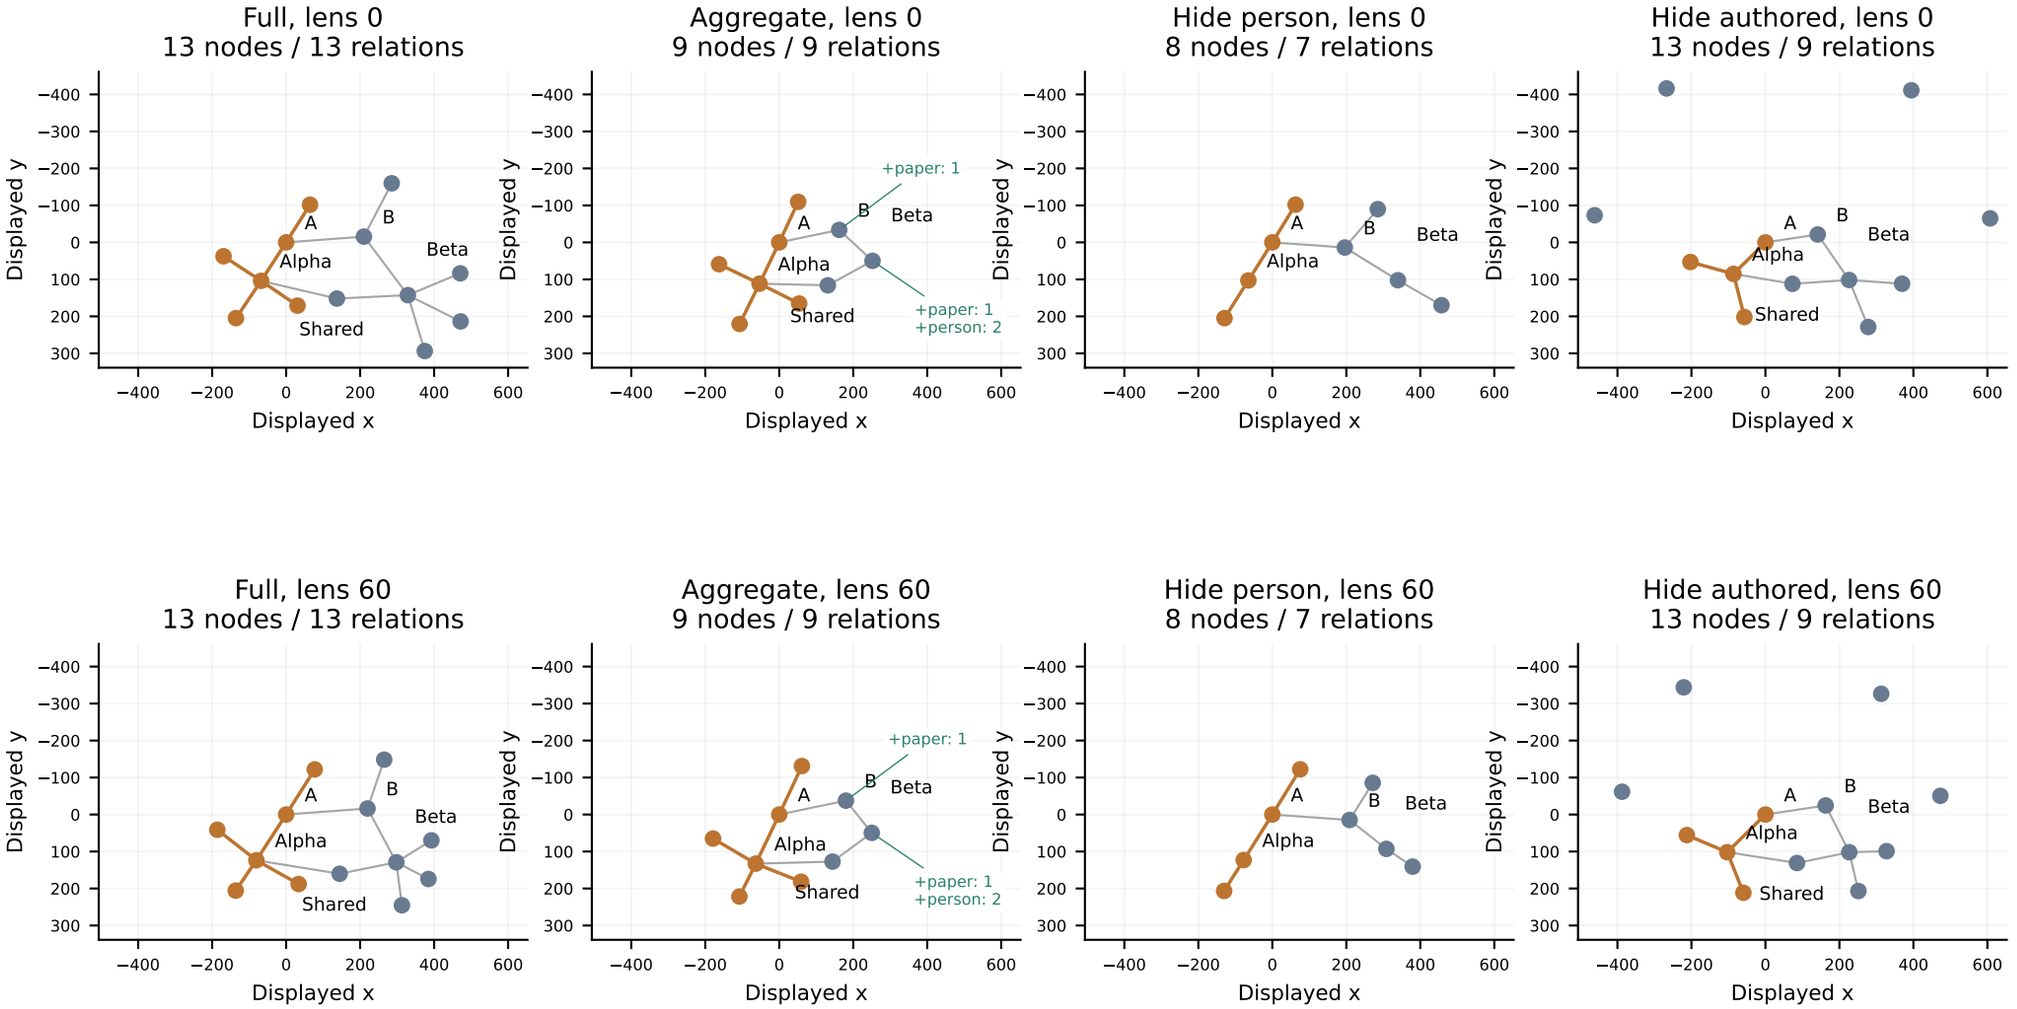
J2. Stored focal detail, structural rules and a separate viewing lens



J2. First seed 0x1234abcd, stored A detail with RFC. All panels share displayed axes, unit spacing/canvas scale and the moving A lens origin. The two rows have identical physical coordinates; only HyperLens strength changes. Orange denotes retained focal members/links, gray context and green typed aggregation counts. Hidden people can remove focal constraints despite protection. Hiding authored relations keeps their paper endpoints visible and isolated. These point/straight-edge drawings omit browser bodies and routed labels; they are synthetic mechanism examples, not reproductions of the 2005 figures.
