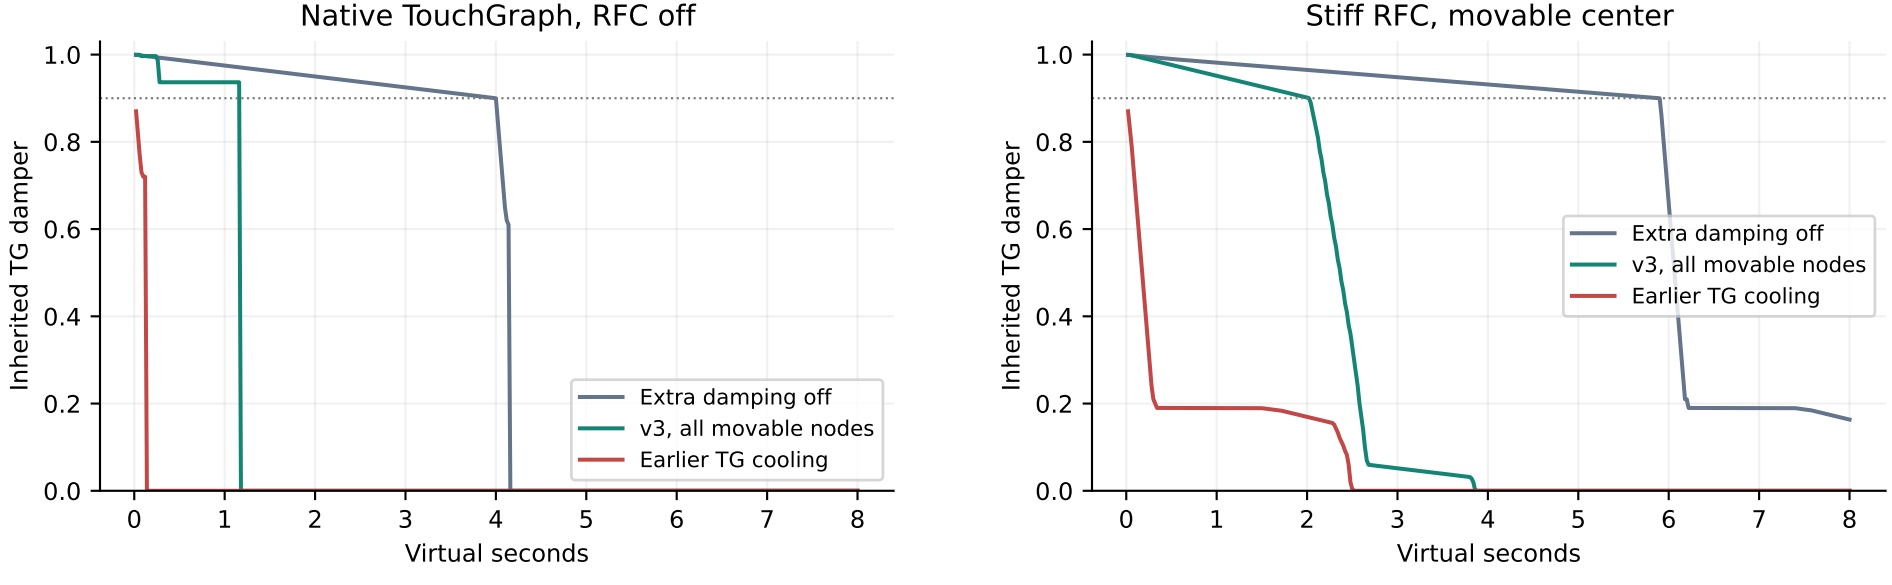
Earlier use of TouchGraph’s existing cooling phase



Experiment K, conservative response. During persistent large motion, the original rule decreases d by 0.0001 per eligible step until d<0.9, then by 0.01. Confirmed oscillation in the early-cooling condition caps d at 0.89 and leaves the remaining TG rule intact. It applies no extra impulse gain and no annealed reheating. Fast cooling starts at 14/12 ms in the native/RFC stress cases, versus 4000/5894 ms with extra damping off. Virtual cadence, not measured browser latency.
