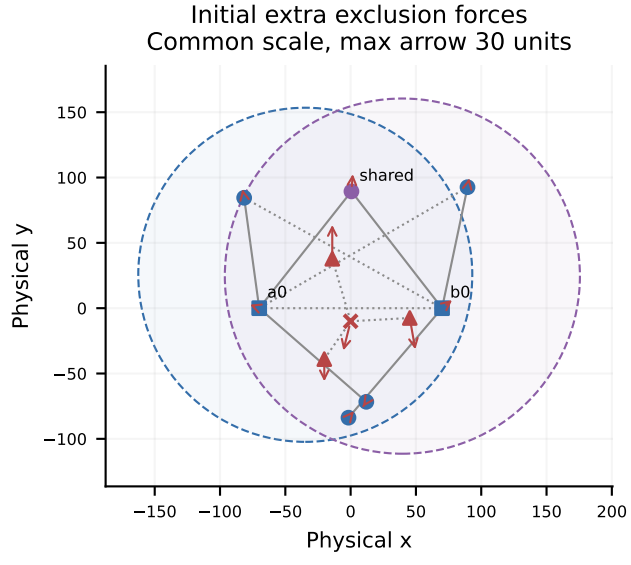
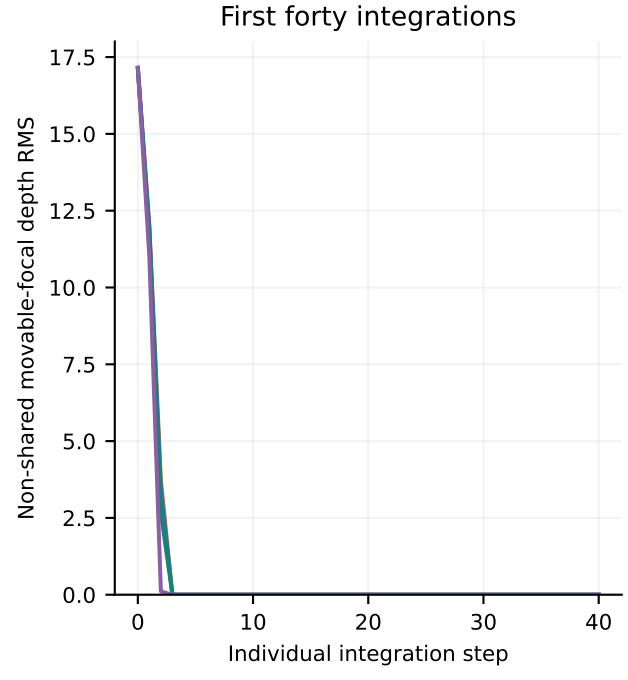
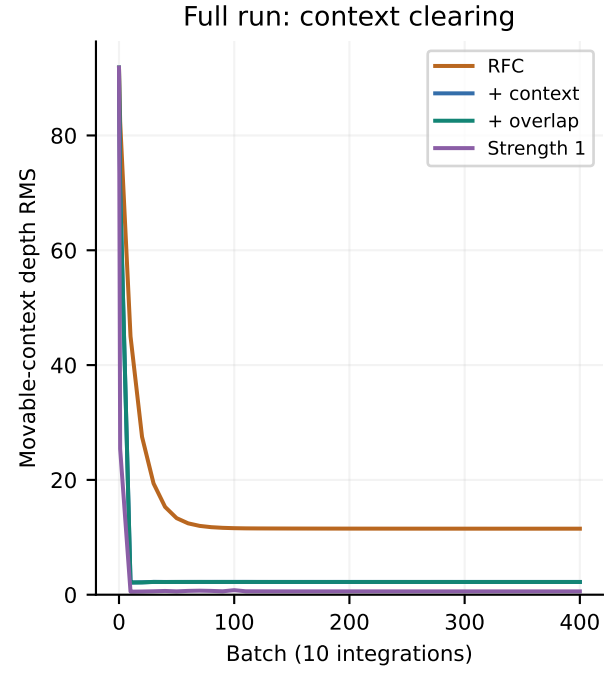
I3. Overlap policy and its limited additional effect on these starts







I3. First seed of the added cross-pressure fixture, all modes retained. Arrows subtract initial RFC-only impulses from overlap-mode impulses, before any integration, and normalize by rigidity; centroid reactions are included. Shared nodes are exempt from direct exclusion but may receive reactions. The existing RFC forces already clear the final non-shared overlap here. Additional exclusion mainly changes the initial response; these data do not establish a general overlap-quality improvement.
