F3. Nonuniform node and link importance

F3. Five movable-root starts per profile and mode. Weighted nodes are a1/b1; weighted relations are a0:a1/b0:b1. The two length columns keep the same links in their denominators, including disabled links. Only priority, not geometry targets, changes. ε is 1e-6; large weights saturate the force mapping but need not give identical trajectories in a nonlinear clipped/cooling layout. Grey baselines coincide across profiles by exact coordinate audit.
