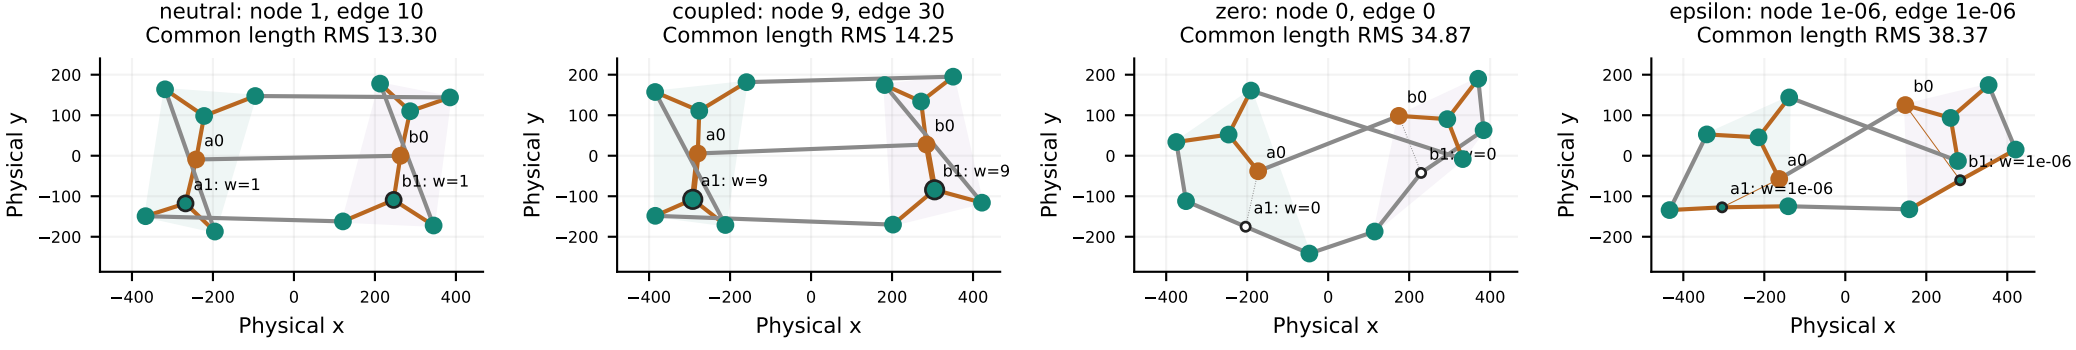
F5. Weight-encoded final layouts: the same graph and start



F5. All panels use damping and shared physical axes; seed 0xdecafbad. Node area and edge width encode bounded importance, not mass. Weighted members a1/b1 are labelled; zero nodes are hollow and zero links dotted. Orange edges show actual active reinforcement; the remaining graph is retained. Membership shading is a physical hull, not the browser renderer. This visual encoding is for the report and does not change browser node sizing.
