
Experiment K. Synthetic matched starts, 4000 integrations, virtual 2 ms per step; no wall-clock performance claim. A imposes positions to test detection only. B–C sample actual travel on every integration, then plot batch maxima; v2/v3 curves coincide on these fast-instability fixtures. D dotted lines mark the last step above 0.1 within the 8 s horizon. Gain recovery is a separate event. Low motion is not force balance, feasibility or readability.
